Examiner

Bradley Edelman

Art Unit

2153

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

## Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

## Status

- 1) ☒ Responsive to communication(s) filed on 24 January 2002.
- 2a) ☒ This action is **FINAL**.                      2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

## Disposition of Claims

- 4) ☒ Claim(s) 23-25,27-31 and 33-39 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 23-25,27-31 and 33-39 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

## Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on \_\_\_\_\_ is: a) ☐ approved b) ☐ disapproved by the Examiner.
- If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

## Priority under 35 U.S.C. §§ 119 and 120

- 13) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
- a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

### DETAILED ACTION

This action is in response to Applicant's amendment and request for reconsideration filed on August 9, 2001. Claims 23-25, 27-31, and 33-39 are presented for further examination.

#### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

1. Claims 23-25, 27, 28, 31, 34-36, 38, and 39 are rejected under 35 U.S.C. 103(a) as being unpatentable over Cave et al. (U.S. Patent No. 5,943,046, hereinafter "Cave").

In considering claim 23, Cave discloses a computer apparatus for allocating communication bandwidth, comprising a server (104) configured to allocate communications bandwidth to a plurality of user stations (102) over a communications interface (103) based on at least one set of priorities, the priorities being based on type of information being retrieved by user stations from the server (col. 7, lines 19-24; col. 8, lines 53-55, 64-67).

Although the system taught by Cave does not explicitly disclose the use of a bus connecting the client stations to the server, Examiner takes official notice that the use of a bus is a well known network standard. It would have been obvious to a person having

Art Unit: 2153

ordinary skill in the art to use a bus to connect the clients to the server disclosed in the system taught by Cave, because buses provide a reliable, high-bandwidth communication medium for local area networks, while increasing flexibility of the system by allowing additional clients to easily connect to the network.

In considering claim 24, Cave discloses a computer apparatus for allocating communication bandwidth, comprising a server (104) configured to allocate communications bandwidth to a plurality of user stations (102) over a communications interface (103) based on at least one set of priorities, the priorities being based on how fast user connections can receive information (col. 7, lines 19-24; col. 8, lines 53-55; col. 9, lines 9-12, wherein it is stated that bandwidth utilized depends on the available bandwidth of the user modem [or other connection means, see col. 6, lines 8-15]).

Although the system taught by Cave does not explicitly disclose the use of a bus connecting the client stations to the server, Examiner takes official notice that the use of a bus is a well known network standard. It would have been obvious to a person having ordinary skill in the art to use a bus to connect the clients to the server disclosed in the system taught by Cave, because buses provide a reliable, high-bandwidth communication medium for local area networks, while increasing flexibility of the system by allowing additional clients to easily connect to the network.

In considering claim 25, Cave discloses a computer apparatus for allocating communication bandwidth, comprising a server (104) configured to allocate

Art Unit: 2153

communications bandwidth to a plurality of user stations (102) over a communications interface (103) based on at least one set of priorities, the priorities being based on which part of a document is being transmitted (col. 7, lines 19-24; col. 8, lines 53-55; col. 9, lines 12-13, wherein it is stated that higher priority image objects [within a specified document] will be allocated greater bandwidth).

Although the system taught by Cave does not explicitly disclose the use of a bus connecting the client stations to the server, Examiner takes official notice that the use of a bus is a well known network standard. It would have been obvious to a person having ordinary skill in the art to use a bus to connect the clients to the server disclosed in the system taught by Cave, because buses provide a reliable, high-bandwidth communication medium for local area networks, while increasing flexibility of the system by allowing additional clients to easily connect to the network.

In considering claim 27, although the system taught by Cave does not explicitly mention the term "stored indicator" indicating importance of a document being retrieved by a user station, such an indicator is inherent in any priority system that assigns priorities to particular documents or files. Thus, because Cave describes allocating bandwidth according to priorities based on individual files (col. 9, lines 9-13), a priority indicator would be inherently included in order to correctly prioritize the data (whether the indicator is the document type/size, some words within the document, a token or tag, or any other type of indicator is irrelevant for the purposes of the claim, since the claim only broadly states the inclusion of an "indicator"). Therefore, Cave inherently

Art Unit: 2153

discloses a stored indicator that indicates importance of a document (i.e. file) being retrieved.

In considering claim 28, as understood, Cave further discloses that the priorities are based on the state of application processes running on a processor (i.e. buffers within processor/memory 106; col. 9, line 57 – col. 10, line 6).

Claims 31, 36, 38, and 39 are disclosed in the same sections of the Cave reference as cited in claims 23, 24, 25, or 27, and are rejected for the same reasons as stated above.

In considering claim 34, Cave further discloses recalculating the bandwidth on an event driven basis (i.e. dynamic allocation, col. 9, lines 22-26).

In considering claim 35, Cave further discloses that events triggering recalculation include at least one of: arrival of a new request for retrieval, finishing sending information in response to a retrieval request, cancellation of a retrieval request, detection of the inability of a user connection to use all of the bandwidth allocated to it, a change or priority, and timeout of a timer (col. 9, lines 25-42; col. 9, line 64 – col. 10, line 6).

Art Unit: 2153

2. Claim 33 is rejected under 35 U.S.C. 103(a) as being unpatentable over Cave, in view of Chen et al. (Threshold-Based Admission Control Policies for Multimedia Servers; The Computer Journal, Vol. 39, No. 9, 1996, hereinafter "Chen").

In considering claim 33, although the system taught by Cave teaches substantial features of the claimed invention, it fails to disclose allocating bandwidth according to a ratio of the priority that a user connection bears to the sum of priorities of all user connections (col. 5, last paragraph). Nonetheless, such an allocation scheme is well known in the bandwidth allocation art, as evidenced by Chen. In a similar art, Chen describes a system for allocating bandwidth among processes in a server, wherein the bandwidth is allocated according to a ratio of the priority that a user connection bears to the sum of priorities of all user connections (col. 5, last paragraph). Thus, given the teaching of Chen, a person having ordinary skill in the art would have readily recognized the desirability and advantages of using the priority ratio disclosed by Chen in the system taught by Cave, in order to maximize the allocation of resources by basing the allocation on a percentage and aiming for 100% distributed allocation (instead of aiming for a static amount that could leave the system either under-utilized or excessively burdened). Therefore, it would have been obvious to use the priority ratio disclosed by Chen in the system taught by Cave.

3. Claims 29, 30, and 37 are rejected under 35 U.S.C. 103(a) as being unpatentable over Cave, in view of Waldron, III (U.S. Patent No. 5,428,789, hereinafter "Waldron").

In considering claim 29, although the system taught by Cave teaches substantial features of the claimed invention, it fails to disclose the state of application processes comprising the foreground or background state of a process. Nonetheless, setting a priority among running processes according to a foreground or background state of the processes is well known, as evidenced by Waldron. In a similar art, Waldron discloses a system for running multiple processes at a user computer, wherein processing priority is given to processes running in the foreground (col. 2, lines 29-39). Given the teaching of Waldron, a person having ordinary skill in the art would have readily recognized the desirability and advantages of prioritizing bandwidth allocation in the system taught by Cave according to the foreground or background state of application processes, as taught by Waldron, so that the currently viewed application can be run or downloaded most quickly. Therefore, it would have been obvious to use the foreground or background priority system taught by Waldron in the system taught by Cave.

In considering claim 30, although the system taught by Cave teaches substantial features of the claimed invention, it fails to disclose the state of application processes comprising a degree to which a window in which a process is running is ready for use by a user. Nonetheless, setting a priority among running processes according to a degree of readiness for use by a user (i.e. whether the process is in a foreground or background state) is well known, as evidenced by Waldron. In a similar art, Waldron discloses a system for running multiple processes at a user computer, wherein processing priority is given to processes running in the foreground (i.e. the processes

Art Unit: 2153

which are most ready for use by a user, col. 2, lines 29-39). Given the teaching of Waldron, a person having ordinary skill in the art would have readily recognized the desirability and advantages of prioritizing bandwidth allocation in the system taught by Cave according to the degree of readiness for use of application processes, as taught by Waldron, so that the currently viewed and thus most usable application can be run or downloaded most quickly. Therefore, it would have been obvious to use the degree of use priority system taught by Waldron in the system taught by Cave.

In considering claim 37, although the system taught by Cave teaches substantial features of the claimed invention, it fails to disclose that the priorities are based on the state of application processes running on the processor. Nonetheless, prioritization schemes based on the state of application processes running on a processor are well known, as evidenced by Waldron. In a similar art, Waldron discloses a system for running multiple processes at a user computer, wherein processing priority is based on the state of an application process running at the computer (i.e. the processes which are most ready for use by a user, col. 2, lines 29-39). Thus, given the teaching of Waldron, a person having ordinary skill in the art would have readily recognized the desirability and advantages of prioritizing bandwidth allocation in the system taught by Cave according to the state of application processes, as taught by Waldron, so that the currently viewed and thus most usable application can be run or downloaded most quickly. Therefore, it would have been obvious to use the state of application process priority system taught by Waldron in the system taught by Cave.

***Response to Arguments***

In response to Applicant's request for reconsideration filed on January 24, 2002, the following factual remarks are noted:

- a. Cave does not teach the use of a bus connected to the various user stations.
- b. The configuration of the claimed communications network, i.e., point to multi-point network configuration, is fundamentally different from that of Cave.
- c. Chen does not disclose that the size of any bandwidth chunk varies according to any set of the priorities, as claimed in claim 31 of the present invention.
- d. There is no factor that Chen uses that teaches or suggests any of the claimed factors of independent claim 31.
- e. Waldron does not teach or suggest the server configured to allocate communications bandwidth to a plurality of stations over the communications interface based on at least one set of priorities as claimed in independent claims 28 and 31 from which claims 29, 30, and 37 depend.

In considering (a), Applicant contends that Cave does not teach the use of a bus connected to the various user stations. Examiner agrees, but has not rejected the claims over Cave alone. Therefore, Applicant's argument is moot.

In considering (b), Applicant contends that the configuration of the claimed communications network, i.e., point to multi-point network configuration, is fundamentally different from that of Cave. Examiner respectfully disagrees. Applicant

Art Unit: 2153

pointed to Figs. 1 & 2, and column 8 lines 50-60 and column 9 lines 9-11 to show that the Cave system is not point to multi-point. However, this interpretation of the Cave reference is incorrect. Figure 1 *explicitly* shows multiple client systems (i.e. satellite sites) connected to the single server. System 102a is the first system, and system 102b is the second system. The figure further depicts that multiple additional systems can also be connected, as signified by the ellipsis. This figure is also explicitly described as point to multi-point in column 6, lines 3-6, wherein it is stated, “[s]ystem 100 includes a primary site 101 and a *plurality of satellite sites* 102; a pair of satellite sites 102a and 102b are shown for reference.” (emphasis added) Therefore, the point to multi-point system taught by Cave is fundamentally the same as the point to multi-point system taught in Applicant’s specification.

In considering (c), Applicant contends that Chen does not disclose that the size of any bandwidth chunk varies according to any set of the priorities, as claimed in claim 31 of the present invention, from which claim 33 depends. This argument is moot for two reasons. First, claim 31 has not been rejected in view of Chen, so the fact that Chen might not disclose particular features of claim 31 is irrelevant. Second, neither claim 31 nor claim 33 include the limitation that “the size of any bandwidth chunk varies according to any set of the priorities.” Claim 31 only requires that bandwidth is allocated according to *at least one* set of priorities (wherein the priority can be based on information type, how fast the user connection can receive information, portion of the document, or an importance indicator). Examiner has relied on Cave in rejecting claim

Art Unit: 2153

31, and Cave discloses allocating bandwidth according to at least one of these criteria.

See col. 8, line 55 – col. 9, line 12. Therefore, claims 31 and 33 remain rejected.

In considering (d), Applicant contends that there is no factor that Chen uses that teaches or suggests any of the claimed factors of independent claim 31. Again, this argument is moot because claim 31 has not been rejected in view of Chen.

Furthermore, Examiner respectfully disagrees with this argument. Notably, Chen teaches a prioritized bandwidth allocation system for use in a client/server environment (see col. 5, “. . . a server capacity reservation is made at the time a new client arrives. A new client is accepted if the remaining capacity can accommodate it . . . we first consider the case then there exist two priority classes of clients . . . .” Therefore, claim 31 remains rejected.

In considering (e), Applicant contends that Waldron does not teach or suggest the server configured to allocate communications bandwidth to a plurality of stations over the communications interface based on at least one set of priorities as claimed in independent claims 28 and 31 from which claims 29, 30, and 37 depend. Examiner agrees. However, neither claim 28 nor 31 have been rejected in view of Waldron. Furthermore, in considering Applicant's arguments with respect to the Waldron reference as they relate to claims 29, 30, and 37, note that one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA

1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986). Cave discloses various priority schemes for use in bandwidth allocation. Waldron also discloses a priority scheme, wherein specific processes are given higher priority than others. Given the teaching of Waldron, a person of ordinary skill in the art who desires to create a prioritized bandwidth allocation system, such as the one taught by Cave, would readily recognize the desirability and advantages of prioritizing bandwidth allocation according specific application processes, as suggested by Waldron, because certain processes may be more important than others. Thus, providing the most important processes with the most bandwidth would allow for optimal system performance.

### ***Conclusion***

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

**THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of

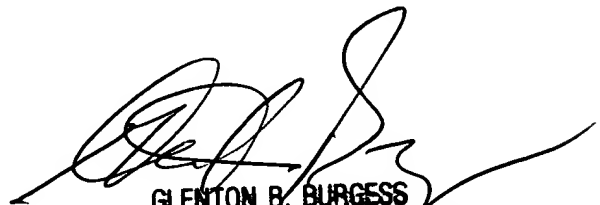

Art Unit: 2153

the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Bradley Edelman whose telephone number is (703) 306-3041. The examiner can normally be reached on Monday to Friday from 8:30 AM to 5:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Glen Burgess can be reached on (703) 305-4792. The fax phone numbers for the organization where this application or proceeding is assigned are (703) 305-7201.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 308-3900.
